* BTRFS => PB: Btrfs stores all links to an inode for a single directory in a fixed-size area.
            Consequently, the max number of hard links to a single file in a single directory
            is very limited: around 300 to 600, depending on the lengths of the file names.

            This limit is not usually an issue, but it does cause problems
            for git, GNUS, GMame and BackupPC. [33]
!!!   ^^^   ^^^^^^^^

            The principal author of the filesystem said that this problem will be fixed in a
            future update.

----

* ZFS => Needs MANY RAM (1 GB is considered as VERY LOW !!)
        ++ 1 (or +) SSD = cache level 2

FONT SIZE 14 + BOLD SHOULD APPEAR, BUT IS HOLLOW !??
