

## XSane scans are offset, scan area not correct

I'm working with debian 9 and trying to config my HP 6830 to scan some A4 documents. I got a problem when I run a preview scan and select in the preview window the area to be scanned. When I next run a full scan, instead of scanning the selected area, the area scanned is displaced slightly smaller than original document.

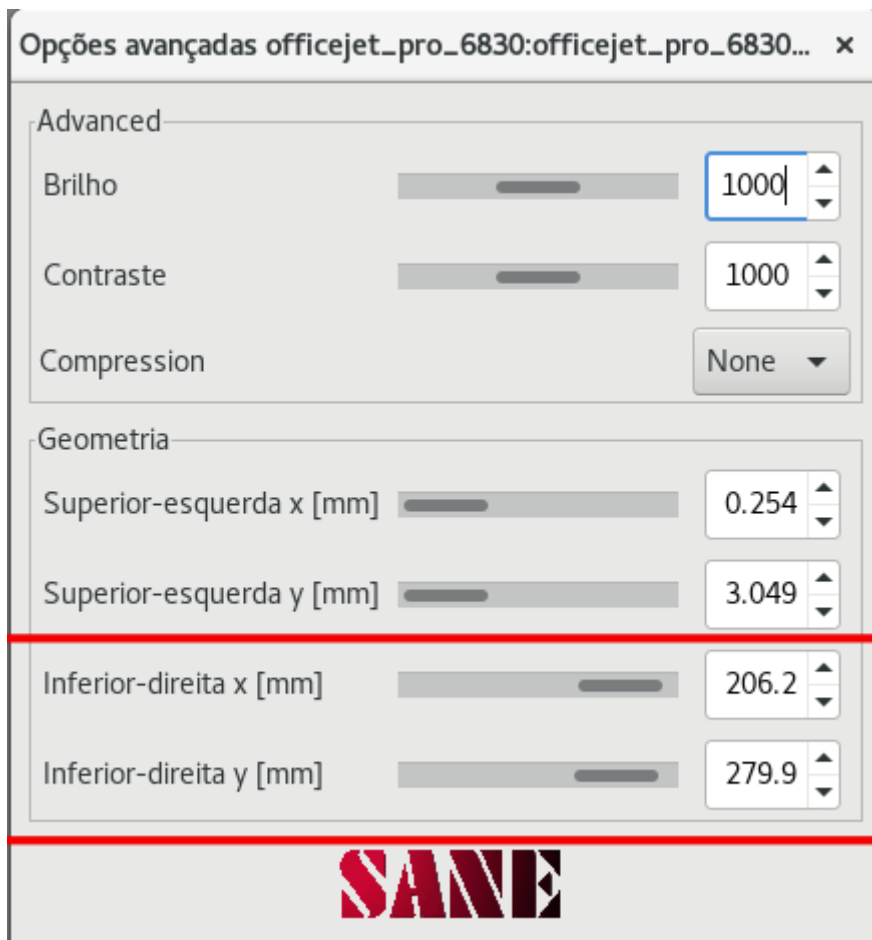

I've tried to make some configurations, but I couldn't find answers and solution to my problem. I reckon it maybe a bug at Xsane 0.999-5.

I've attached some screens for xsane configurations. Even when I click at preview, scanning page seems with low size and different of preview selection.

Pic.1 Scan result (smaller size) – Selected paper size was DIN A4

Pic. 2 – Advanced Options – They are correct, in this case I was configured A4 DIN size

Pic. 3 – Dimensions are different of advanced config. Properties.
