

IMAP problem for "Pasteur" account

The so-called UIDVALIDITY value of the mailbox "recrutements" has changed. MailMate has to resynchronize the mailbox, that is, purge the local cache and refetch the messages of the mailbox.

If this happens often then you should investigate the issue. Refetching messages is a very inefficient action.

Note: The option to "Always Resynchronize" only works until MailMate is relaunched.

Resynchronize

Always Resynchronize
